

Backend Engineer (Mid-level) — Acme Tech

Acme Tech · Platform Team · Remote-friendly · Full-time

About Acme Tech

Acme Tech is a fictional company used for EZ-Interview sample data. We are migrating our monolithic e-commerce platform into a set of loosely-coupled domain services and are hiring a backend engineer to help stabilize order/payment APIs and grow the platform.

Responsibilities

- Design and implement REST APIs for the order/shipment domain using Python (FastAPI) or Node.js
- Tune PostgreSQL queries — read execution plans, add indexes, and remove N+1 anti-patterns
- Move side-effects (emails, settlement) into Celery / RabbitMQ workers
- Write unit & integration tests (pytest), actively participate in code review
- Investigate production incidents using logs, metrics, and traces

Requirements

- 2+ years building backend services in Python or another modern language
- Hands-on REST API experience with FastAPI / Flask / Express
- PostgreSQL or MySQL schema design experience
- Comfortable with Git workflows, code review, and Docker
- Good written English for async collaboration

Nice to Have

- Demonstrated performance optimization (e.g., N+1 fixes, index tuning)
- Experience with Celery, RabbitMQ, Kafka or similar queues
- AWS EC2/RDS/S3 basic operations
- CI pipelines on GitHub Actions / GitLab CI
- Side projects with RAG, vector DBs, or LLM tooling

Tech Stack

Python · FastAPI · SQLAlchemy · Pydantic · PostgreSQL · Redis · Celery · Docker Compose · AWS (EC2/RDS) · GitHub Actions · pytest

Benefits

- Flexible hours (10–11 AM start, 8h working day)
- \$10/day lunch stipend, quarterly \$300 book budget
- Generous PTO + sabbatical every 3 years

This JD is synthetic sample data created for the EZ-Interview project. Any resemblance to a real company is coincidental.
